Study Sampling Methods

• 654 parents of children living in the Dayton Children’s Medical Center general service area were surveyed either online or via telephone interview between January 31 and March 9, 2001. Respondents to the online surveys were incented by having their names entered into a drawing for one of three $100 Kohl’s gift cards.
  – 228 respondents came from a list of parents who subscribe to the Dayton Children’s Medical Center email newsletter who completed the assessment via a password controlled web survey.
  – 173 responses came from parents who received an open invitation to complete the survey via announcements in the local press and completed via an open source web survey.
  – 253 surveys were completed via telephone interviews with parents who were selected from published telephone lists. Telephone respondents were selected at random proportionately to the populations of the nine counties primarily served by Dayton Children’s Medical Center.

• Results were combined and weighted by key demographic factors in order to more closely match U.S. census figures for the region.

• Previous waves of the assessment had been conducted exclusively using random telephone interviewing. In recent years the proportion of families who rely exclusively on mobile phones has increased dramatically nationwide, resulting in significant declines in telephone survey response rates especially among parents of young children. This has led health and epidemiological organizations such as the National Center for Health Statistics to recommend mixed online and telephone sampling methods for the assessment of child health.

• The combination of online and telephone sampling methods coupled with demographic weighting allowed this study to come within one or two percentage points of the most recent census figures for key demographic statistics for the Miami Valley area (based on 2009 U.S. Census results for the nine county Dayton Children’s Medical Center primary service area).

2009 Census*

Under 200% Poverty
Above 200% Poverty

*Based on 2009 Census results available for Allen, Butler, Clark, Greene, Miami, Montgomery and Warren Counties.
Parents were asked to indicate up to three health issues that are of the greatest concern to them.

Parents of boys are more likely to be concerned about asthma (21% vs. 14%) and developmental disabilities (19% vs. 13%) than are parents of girls. Parents of girls are more likely than parents of boys to be concerned about viral infections (18% vs. 12%). Parents with incomes below 200% of poverty are more likely to be concerned about asthma (21% vs. 15%) and ADHD (27% vs. 11%) than are parents above 200% of poverty, while wealthier parents are more likely to be concerned about diet and nutrition (37% vs. 27%) than are parents living below the 200% of poverty threshold.
Middle income parents are significantly more likely to view high medical costs as a problem than are either low income or high income parents.
Parents with higher deductibles and co-pays and those who use private insurance are significantly more likely to see high medical care costs as a problem than are parents with lower deductibles and co-pays or those who receive Medicaid or military health care.
Boys from lower income households are significantly less likely to be considered by their parents to be in very good or excellent health than are either boys from higher income households or girls at any income level.
Has this child had any of the following common childhood ailments during the past 12 months?

- Common cold: 75%
- Ear infection: 23%
- Strep throat: 21%
- Flu, influenza: 17%
- Skin condition: 11%
- Dental problem: 8%
- Three day fever: 4%

Emergency Care and Income

Children do not differ by income level in their need for emergency care or the type of facility they use for emergency care.

- Emergency Care
  - Under 200% Poverty: 37%
  - Above 200% Poverty: 40%

- ER
  - Under 200% Poverty: 19%
  - Above 200% Poverty: 17%

- Urgent Care
  - Under 200% Poverty: 14%
  - Above 200% Poverty: 18%

- Dr. Office
  - Under 200% Poverty: 16%
  - Above 200% Poverty: 15%

N= 566
While children do not differ overall in their frequency of use of emergency services, children from lower income households appear more likely to use emergency services for a number of conditions. Only asthma attack showed a statistically significant difference, however a significant trend is clear across a number of illnesses.
Emergency Care and Income (b)

Type of Emergency Care by Income Level

- Flu: 7% (Under 200% Poverty), 8% (Above 200% Poverty)
- Abdominal pain: 5% (Under 200% Poverty), 5% (Above 200% Poverty)
- Difficulty breathing: 4% (Under 200% Poverty), 5% (Above 200% Poverty)
- Pneumonia: 5% (Under 200% Poverty), 5% (Above 200% Poverty)
- Head injury: 4% (Under 200% Poverty), 5% (Above 200% Poverty)
- Bronchitis: 4% (Under 200% Poverty), 5% (Above 200% Poverty)
- Sprain (leg): 3% (Under 200% Poverty), 4% (Above 200% Poverty)
- Dehydration: 4% (Under 200% Poverty), 5% (Above 200% Poverty)
- Sprain (arm): 3% (Under 200% Poverty), 5% (Above 200% Poverty)
- Urinary infection: 3% (Under 200% Poverty), 5% (Above 200% Poverty)
- Needed stitches: 3% (Under 200% Poverty), 4% (Above 200% Poverty)
- Appendicitis: 0% (Under 200% Poverty), 1% (Above 200% Poverty)
- Facial injury: 0% (Under 200% Poverty), 2% (Above 200% Poverty)
- Eye injury: 0% (Under 200% Poverty), 1% (Above 200% Poverty)
- Facial symptoms: 1% (Under 200% Poverty), 2% (Above 200% Poverty)
- Other (Please specify): 11% (Under 200% Poverty), 17% (Above 200% Poverty)

N= 566

Children from higher income households use emergency services more often than children from lower income households only for a few less frequent conditions. None of these differences were statistically significant. Children from higher income households were more likely to use emergency services for a variety of other reasons.
Emergency Care and Income

Child Activity/Emergency Care by Income Level

N= 58 children who received emergency treatment for injuries.

- Household accident: 45% (Under 200% Poverty), 19% (Above 200% Poverty)
- General play: 32% (Under 200% Poverty), 19% (Above 200% Poverty)
- School activity: 27% (Under 200% Poverty), 20% (Above 200% Poverty)
- Organized sports: 20% (Under 200% Poverty), 27% (Above 200% Poverty)
- Car or bicycle accident: 13% (Under 200% Poverty), 2% (Above 200% Poverty)
- Unorganized sports: 8% (Under 200% Poverty), 5% (Above 200% Poverty)

Children from households with incomes less than 200% of federal poverty levels were more than twice as likely to experience a household accident that led to emergency treatment.
Emergency Care and Income

Emergency Care and Asthma by Income Level

- Airborne allergies
  - Under 200% Poverty: 7%
  - Above 200% Poverty: 11%

- Asthma (Incidence)
  - Under 200% Poverty: 9%
  - Above 200% Poverty: 9%

- Emergency Care
  - Under 200% Poverty: 37%
  - Above 200% Poverty: 40%

- Concern about Asthma
  - Under 200% Poverty: 21%
  - Above 200% Poverty: 15%

- Asthma Attack > ER*
  - Under 200% Poverty: 12%
  - Above 200% Poverty: 4%

N = 625 Total children
N = 233 Children receiving emergency care
*= Statistically significant difference

Children do not differ by income level in the incidence of either asthma or airborne allergies nor in overall use of emergency services. However, lower income parents do use emergency services significantly more often for asthma attacks and are more concerned about asthma as an issue than are higher income parents.
Dental Issues by Income

N= 387 children between the ages of 6 and 14

Children from households below 200% of poverty are significantly more likely to have toothaches or other dental problems and to use emergency services for them. They are also significantly more likely to brush less often. Children do not differ by income in the frequency with which they visit the dentist for checkups.
Influenza by Income

N= 383 children between the ages of 6 and 14

Children from households below 200% of poverty are significantly more likely to have never had a flu shot. They are also slightly more likely to have had the flu in the past year and to have used emergency services for the flu. Children did not differ by income in the frequency with which they have had vaccinations.
Overweight, Obesity and Underweight

Based on child’s age, height and weight. 5th percentile and under qualify as underweight. 85 percentile to 95th percentile count as overweight. 95th percentile and over count as obese. 2009/10 Ohio figures are from the “2004-2010 Third Grade BMI Report”, Ohio Department of Health, based on measures of 3rd graders across the state of Ohio and do not include figures for underweight children.
Parents' Perceptions of Child’s Weight

Parents were asked to indicate whether they think their child is underweight, about the right weight, slightly overweight or very overweight. The majority of parents of overweight and obese children do not perceive their children as having any weight problem. Between 7% and 8% of parents of overweight and obese children believe that their children are underweight and 5% of parents of underweight children believe that their child is overweight.
The majority of underweight, overweight and obese children are not doing anything to change their weight. Parents were asked whether their child was trying to lose weight by either dieting or exercising or to gain weight. About half of children who are trying to lose weight do so by restricting caloric intake (dieting), about half do so by exercising more and about 20% do both.
Overweight and Asthma

Overweight and obese children are significantly more likely to have asthma.

Asthma by BMI Percentile Group

- Underweight: 7%
- Healthy Weight: 7%
- Overweight: 14%
- Obese: 15%

N = 541
Daily Servings of Fruits and Vegetables

The proportion of children who eat five or more portions of fresh fruits and vegetables daily has not changed since the 2008 study.
Daily Servings Specific Foods

Servings of Specific Foods

- **Fast Food**: 73% daily, 22% occasional
- **Potatoes**: 9% daily, 11% occasional, 59% frequent
- **Milk**: 17% daily, 27% occasional, 22% frequent, 12% occasional, 14% frequent, 7% rare
- **Fruit Juice**: 10% daily, 23% occasional, 12% frequent, 31% occasional, 21% frequent
- **Fruits**: 12% daily, 29% occasional, 24% frequent, 14% occasional, 16% frequent
- **Vegetables**: 10% daily, 29% occasional, 24% frequent, 16% occasional, 16% frequent

N= 600
Obese children eat significantly more servings (about 50% more) of potatoes per week than do healthy weight children.
Child Diet and Underweight

Underweight children drink significantly more fruit juices than do healthy weight children.

* Statistically significant difference

N= 600

Dayton Children's 2011 Health and Safety Assessment
Child Sleep and Asthma

Children between the ages of 6 and 10 who have asthma get significantly less sleep at night than do children of the same age who do not have asthma. Between the ages of 11 and 14 as children begin to sleep less, this difference appears to begin to even out.
Preschool children from households under 200% of federal poverty limits are twice as likely to be at home with a parent or in a public preschool program. Children living in households above 200% of federal poverty levels are over twice as likely to spend the day in a private daycare program. Over 20% of all preschool children in private daycare are in an unlicensed daycare program.
Where are the Children? School Age

N= 386 children between the ages of 6 and 14

Children do not differ by household income in the type of school they attend.
Where are the Children? After School

6 to 10 Year Olds: After School By Income

N= 199 children between the ages of 6 and 10

6 to 10 year old children from households under 200% of federal poverty levels are significantly more likely to spend their afternoons at home supervised by a parent. 3% of all children between the ages of 6 and 10 spend their afternoons at home unsupervised.
Where are the Children? After School

11 to 14 Year Olds: After School By Income

- **Total:**
  - School Program: 11%
  - Private child care: 75%
  - At home - supervised: 14%
  - At home - unsupervised: 7%
  - Friend's home: 9%

- **Under 200% Poverty:**
  - School Program: 7%
  - Private child care: 81%
  - At home - supervised: 15%
  - At home - unsupervised: 13%
  - Friend's home: 8%

- **Above 200% Poverty:**
  - School Program: 13%
  - Private child care: 71%
  - At home - supervised: 13%
  - At home - unsupervised: 8%
  - Friend's home: 8%

N= 185 children between the ages of 11 and 14

Children from households under 200% of federal poverty levels are significantly more likely to spend their afternoons at home supervised by a parent. 14% of all children between the ages of 6 and 10 spend their afternoons at home unsupervised.

Children from households above 200% of poverty are almost twice as likely to spend their afternoons at a school sponsored program.
What are they up to? 6 to 10 Year Olds

N= 203 children between the ages of 6 and 10

6 to 10 Year Olds: How They Spend Their Days

- **Watching TV**: 13% None, 28% Less than one hour, 36% One hour, 16% Two hours, 21% Three hours+
- **Non-organized physical activities**: 16% None, 25% Less than one hour, 32% One hour, 16% Two hours, 11% Three hours+
- **Doing homework**: 4% None, 39% Less than one hour, 45% One hour, 8% Two hours, 5% Three hours+

- Playing video games: 25% None, 29% Less than one hour, 29% One hour, 8% Two hours, 9% Three hours+
- Texting on a mobile phone: 38% None, 32% Less than one hour, 16% One hour, 4% Two hours, 10% Three hours+

88% of 11 to 14 year olds spend an hour or more each day watching television. 78% spend an hour or more per day doing homework. 60% spend an hour or more per day participating in organized sports. About half spend an hour or more per day on the Internet, participating in extracurricular activities, engaging in non-organized physical activities or playing video games. Nearly one third of children aged 11 to 14 spend an hour or more per day texting on mobile phones.
Nearly 100% of children of all ages use either seat belts or car seats regularly. For 2005 and 2008 the responses are for those using car restraints “always” or “most of the time”. For 2011 the responses are those agreeing that the child “regularly uses a car seat or wears a seatbelt when riding in a car.”
Bicycle Safety

4 to 8 Year Olds
2002 N = 143
2005 N = 147
2008 N = 155
2011 N = 201

9 to 14 Year Olds
2002 N = 233
2005 N = 247
2008 N = 226
2011 N = 233

Percent Regularly Using Bicycle Helmets

Older children are more likely to not use a bicycle helmet. There appears to be an increasing trend for children to use bicycle helmets more often, however this should be viewed with caution because of changes in the survey question. For 2002 to 2008 the responses are for those using helmets “always” or “most of the time”. For 2011 the responses are those agreeing that the child “regularly wears a helmet when riding a bicycle.” Includes only children who ride bicycles.
Scooter, Skateboard and Rollerblade Safety

Older children are more likely to not use helmets when riding scooters, skateboards or rollerblades. As with bicycles, there appears to be an increasing trend for children to use helmets more often, however this should be viewed with caution because of changes in the survey question. For 2002 to 2008 the responses are for those using helmets “always” or “most of the time”. For 2011 the responses are those agreeing that the child “regularly wears a helmet when riding a scooter, skateboard or rollerblades outdoors.” Includes only children who ride scooters, skateboards or rollerblades.
Children living in the northern service region are consistently more likely to ride bicycles without helmets than are children in either the primary or the southern service regions. For 2002 to 2008 the responses are for those using helmets “always” or “most of the time”. For 2011 the responses are those agreeing that the child “regularly wears a helmet when riding a bicycle.” Includes only children who ride bicycles.

Is Bullied by Others

- Never
- Rarely
- Sometimes

Children who have certain mental health and developmental disabilities are significantly more likely to be the targets of bullying. Children who have asthma are also significantly more likely to be bullying targets. “Mental Health Issues” includes depression, anxiety disorders, eating disorders, sleep disorders and general mental health issues. “Learning Disabilities” includes general learning disabilities and ADHD.
Bullying and Being Bullied

Percent of Children Who Bully Others

- **All Children**: 76% (Never Bullied: 91%, Rarely Bullied: 76%, Sometimes Bullied: 59%)
- **Never Bullied**: 91% (18% Bullied by Others, 6% Bullies Others)
- **Rarely Bullied**: 76% (23% Bullied by Others, 1% Bullies Others)
- **Sometimes Bullied**: 59% (25% Bullied by Others, 16% Bullies Others)

N = 398 School Age Children

Children who are sometimes bullied are significantly more likely to bully other children themselves.
Over two thirds of all children were breastfed for at least some of their infancy. The amount of breast feeding varies by income and ethnicity with White mothers being about 50% more likely than African American mothers to breastfeed their children for at least most of the first year of life. Mothers with incomes below 200% of the federal poverty level are about twice as likely to forego breastfeeding.
Breastfeeding is significantly correlated with the educational level of the mother. Parents with college degrees are significantly more likely to breastfeed and to breastfeed longer than are parents with less than a college degree.
Breastfeeding and Autism

The results suggest the possibility of a relationship between breastfeeding and Autism Spectrum Disorder. 12 out of 371 (3%) children ages 6 to 14 were diagnosed with a disorder on the autism spectrum. 11 out of the 12 had not been breastfed. One had been breastfed for only a short time. When asked why they did not breastfeed, two parents said that the baby refused breastfeeding; two said that the mother did not like breastfeeding; four cited the mother’s health; one mother had to return to work; and two of the children were adopted. While these results are statistically significant at the 95% confidence level, they are based on a small number of cases and should be viewed with caution.
A clear interaction exists between gender, income and ADHD. One quarter of boys whose families earn less than 200% of the federal poverty level have been diagnosed with ADHD, compared to 10% of boys whose families earn more than 200% of the federal poverty level. Girls are significantly less likely to be diagnosed with ADHD, regardless of family income, but girls from lower income families are five times as likely to receive the diagnosis than are girls from higher income families. Based on results for school age children between the ages of 6 and 14.
ADHD by Gender and Income

The interaction between gender, income and ADHD has existed across waves of this assessment with lower income boys being significantly more likely to receive the diagnosis than either girls or higher income boys.
